

Adding a project to your CV is all about showcasing the **skills** and **impact** in a way that recruiters instantly understand. Since you've built an end-to-end system, you're going to stand out.

Here's exactly how to phrase it, where to place it, and how to tailor it to the job you want.

1. Where to put it on your CV

Create a dedicated section titled **"Projects"** (or **"Personal Projects"** if you have no professional experience).

Place it:

- Right after **Education** if you're a recent graduate.
- Right after **Work Experience** if you already have some professional background.

2. The three bullet-point formula

For each project, use 2–3 bullet points that follow this pattern:

> **What you did** → **How you did it (tech stack)** → **The result or business value**

Below are ready-to-use bullet points for your inventory project. Choose the set that best matches the role you're targeting.

Set A – General Data Analyst / BI Developer (balanced)

```markdown

**Inventory Management System with Low-Stock Alerts** | GitHub Link

- Designed a transactional SQL Server database (4 tables, T-SQL) to track products, suppliers, stock movements, and purchase orders, enabling real-time stock calculation and automatic reorder detection.
- Built Python scripts (pyodbc, smtplib) to simulate sales, log inventory changes, and automate a daily CSV export of low-stock items, with email alerts sent via Gmail SMTP.
- Developed a Power BI dashboard featuring red/green conditional formatting, supplier performance metrics, and a suggested reorder list, providing a single-view decision-support tool for restocking.

```

Set B – Database / Data Engineering focus (emphasize SQL, transactions, automation)

```markdown

**\*\*Inventory Management System\*\*** | GitHub Link

- Modelled a normalized SQL Server database for inventory transactions, implementing foreign keys, check constraints, and a stock\_movements log to maintain full auditability.
- Created a Python CLI using pyodbc with explicit transaction management (commit/rollback) to handle concurrent sales safely, preventing data inconsistencies.
- Automated a morning stock-check pipeline that queries the database, exports a CSV of products below reorder threshold, and sends it via email, scheduled with Windows Task Scheduler.

```

Set C – Power BI / Data Visualization focus

```markdown

**\*\*Inventory Management Dashboard\*\*** | GitHub Link

- Built an end-to-end inventory analytics solution: from SQL Server database design to a live Power BI dashboard with dynamic KPI cards and conditional formatting.
- Used DAX measures to calculate stock on hand, low-stock flags (0/1), supplier order fulfilment rates, and suggested order quantities.
- Delivered actionable insights such as a real-time low-stock alert table and supplier performance comparison, reducing manual report generation from hours to zero.

```

Set D – Very short (if space is tight)

```markdown

**\*\*Inventory Management System\*\*** (SQL Server, Python, Power BI)

- Designed a transactional inventory database with automated low-stock detection via T-SQL.
- Built Python scripts for sales recording and daily CSV/email alerts, plus a Power BI dashboard with real-time stock alerts.

```

3. Tailoring tips

- ****If the job description mentions SQL Server, T-SQL, or database design:**** use Set B and explicitly mention “foreign keys”, “transactions”, “auditability”.
- ****If the job is about Power BI or data visualization:**** use Set C and highlight DAX, conditional formatting, and the business insight.
- ****If the job is a general data analyst role:**** use Set A, which covers the full pipeline.
- ****If you’re applying in a French-speaking environment,**** translate the bullet points but keep the technical terms in English if they are standard (pyodbc, Power BI, etc.). I can translate them for you if you wish.

4. Include the GitHub link

Next to the project title, add a clickable hyperlink to your GitHub repository.

If you have published the Power BI dashboard to the web, you can also add: `[Live Dashboard](link)` next to the title – that makes it incredibly impressive.

5. One extra detail that makes a huge difference

Add a brief ****“Technologies”**** line after the bullet points (or in a separate column) so the recruiter’s eye catches the keywords instantly. For example:

> ****Technologies:**** SQL Server, T-SQL, Python (pyodbc, smtplib), Power BI (DAX), Windows Task Scheduler, Git

6. Example final CV section

Here’s exactly how it might look on a PDF:

```
> **PROJECTS**
>
> **Inventory Management System with Low-Stock Alerts** |
[GitHub](https://github.com/rouaasllimi/Inventaire_management_system)
> *Technologies: SQL Server, T-SQL, Python (pyodbc, smtplib), Power BI (DAX), Windows Task
Scheduler*
> - Designed a transactional database for products, suppliers, stock movements, and orders;
wrote T-SQL queries to compute real-time stock levels and detect items needing reorder.
> - Developed Python scripts for sales recording with transaction integrity and automated a daily
low-stock check that exports a CSV and sends email alerts.
```

> - Built a Power BI dashboard with red/green conditional formatting, supplier performance visuals, and a dynamic suggested reorder table, enabling instant stock status overview.

That's it. Your project is now CV-ready.

If you want me to rewrite the bullets in French or for a specific job ad you've found, just share the job title or description and I'll tailor them perfectly.
